

S_AWS_04 Load Balancer And Bastion Server

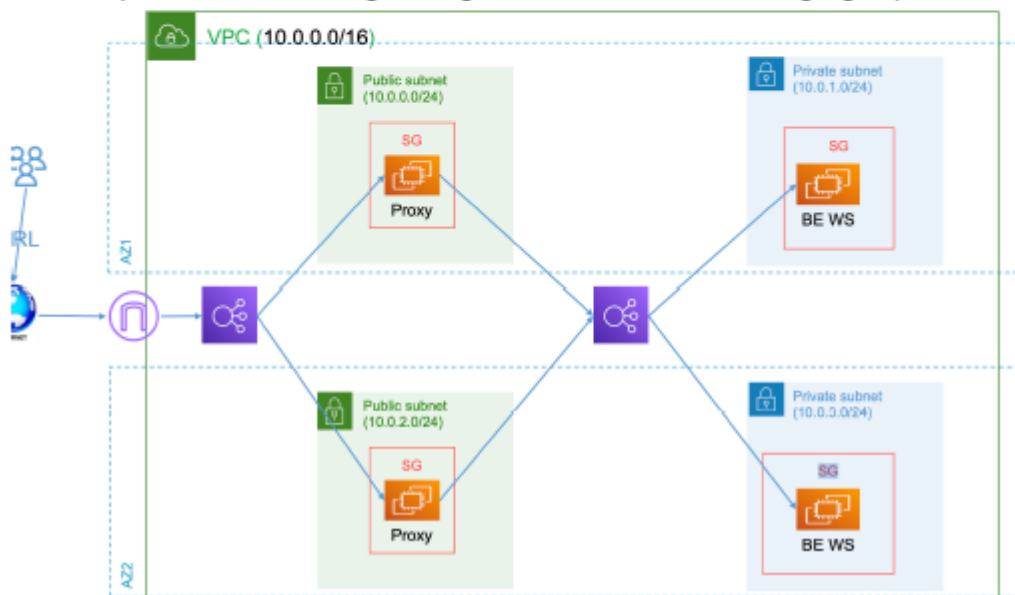

Khaled Dawoud
JUNE 2023
AWS – DEVOPS

Lab3

- 1- Launch a jump host
 - Take a screenshot while you are ssh to the jump host
 - Also When you ssh from bastion to the private machine
 - Screenshot from the console showing the instances ips

- 2- Implement the below diagram then take a screenshot while you put dns of the load balancer into the browser and it returns a response from the 2 apache instances
Also Screenshot from the console showing the machines BE WS have private Ips
And finally a screenshot showing the targets of the 2 loadbalancers target groups are healthy

3- Autoscaling for the private servers.

Apache2 Ubuntu Default Page: 1 x +

← → ↻ ⌂ ⚠ Not secure loadbalancer-public-592920710.us-east-1.elb.amazonaws.com ☆ Incognito Update

Apache2 - Private Instance 1

Ubuntu

It works!

This is the default welcome page used to test the correct operation of the Apache2 server after installation on Ubuntu systems. It is based on the equivalent page on Debian, from which the Ubuntu Apache packaging is derived. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should **replace this file** (located at `/var/www/html/index.html`) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.

Configuration Overview

Ubuntu's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Ubuntu tools. The configuration system is **fully documented in `/usr/share/doc/apache2/README.Debian.gz`**. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the **manual** if the `apache2-doc` package was installed on this server.

The configuration layout for an Apache2 web server installation on Ubuntu systems is as follows:

```
/etc/apache2/
|-- apache2.conf
|   |-- ports.conf
|-- mods-enabled
|   |-- *.load
|   |-- *.conf
|-- conf-enabled
|   |-- *.conf
|-- sites-enabled
|   |-- *.conf
```
